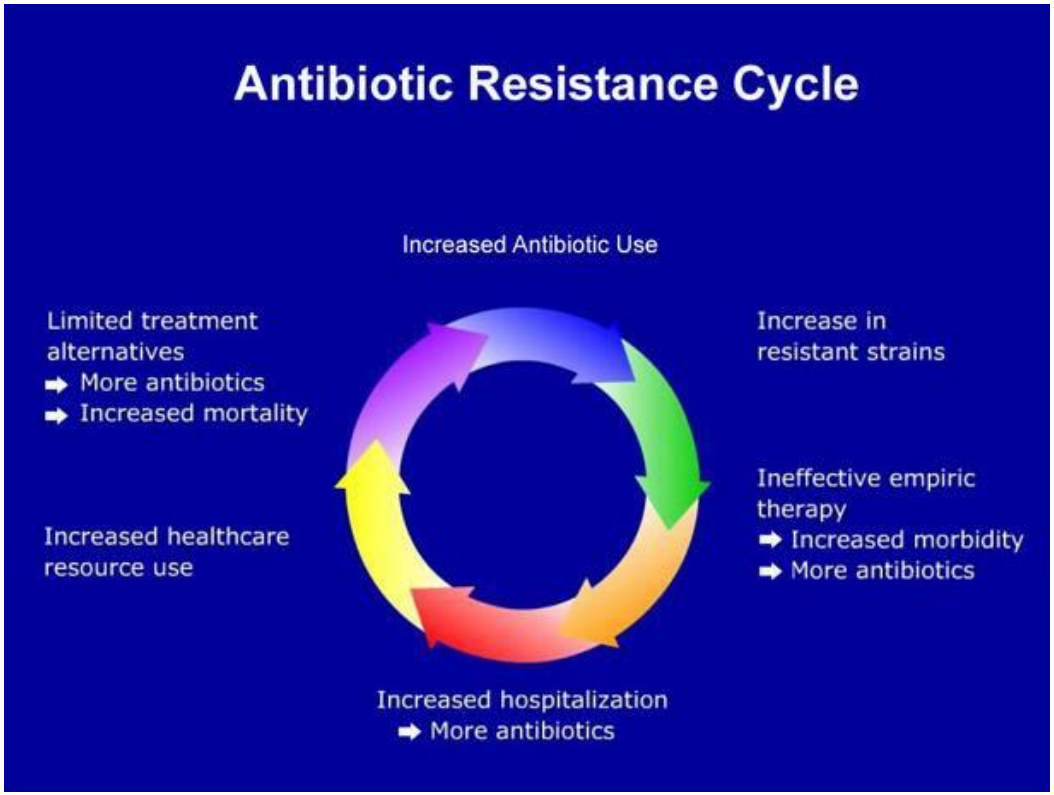
North East London (NEL) Management of Infection Guidance for Primary Care

Adapted from the Public Health England (PHE) and National Institute for Health and Care Excellence (NICE) Management of infection guidance. For primary care use across the East London Health and Care Partnership (ELHCP)



https://asweknowitlife.wordpress.com/2012/12/04/antibiotic-resistance-cycle/

Updated: August 2023
Date of review: August 2024, or sooner if required
Version: 1.7

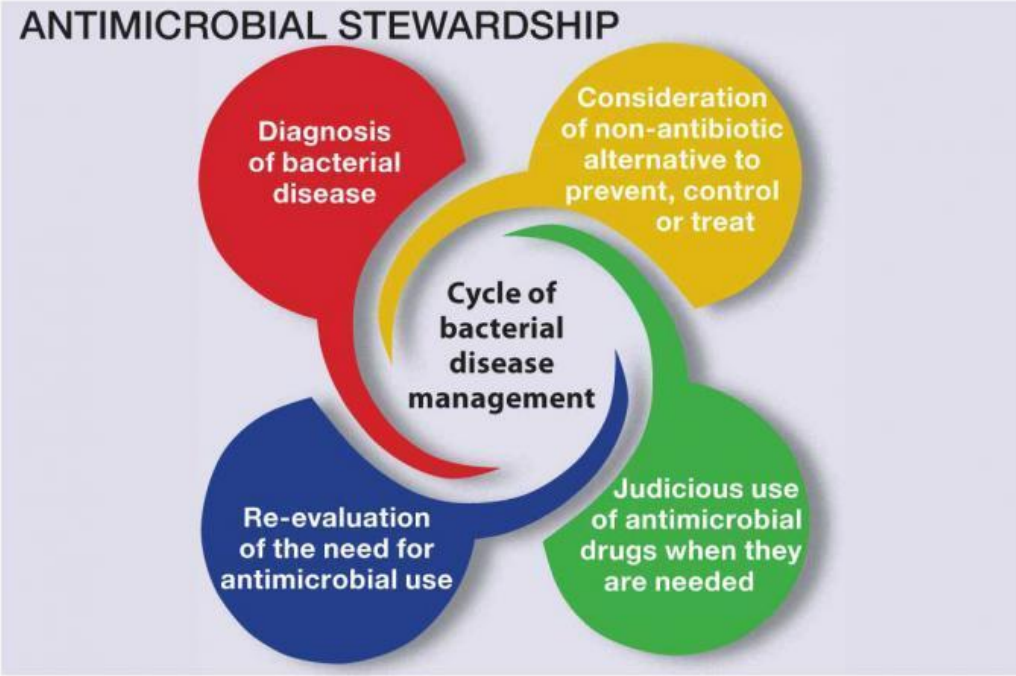
These guidelines have been developed in collaboration with:

- North East London Integrated Care Boards (NEL ICB)
- Barking, Havering and Redbridge University NHS Trust (BHRuT) Microbiology team
- Barts Health NHS Trust Microbiology teams
- Homerton Healthcare NHS Foundation Trust Microbiology team (HHFT)
- NHS North East London NHS Foundation Trust (NELFT)
- NHS East London NHS Foundation Trust (ELFT)

The guideline review group has involved a range of healthcare professionals including GPs, Microbiologists/Infectious disease consultants, Primary Care Pharmacists, Prescribing Advisors, and Antimicrobial Pharmacists. Advice has also been sought from local dermatologists, obstetricians and gastroenterologists where appropriate.

The development and maintenance of this guideline is a key function of the North East London Antimicrobial Resistance Strategy Group (NEL AMRSG), which is a local collaboration of health and social care partners.

Contents



Ratified via Chairs Action by North East London Integrated Medicines Optimisation Committee	18th August 2023
Approved via Chairs Action by North East London Formulary & Pathways Group	18th August 2023
Endorsed by North East London Antimicrobial Resistance Strategy Group (NEL AMRSG)	29th June 2023

Guideline Statement

These guidelines are to be read in conjunction with current guidance from NICE and PHE, other national bodies (e.g. BASHH – British Association for Sexual Health and HIV), relevant NICE Clinical Knowledge Summaries (CKS) and resources from the RCGP TARGET Toolkit. Evidence-based antimicrobial prescribing is essential to begin to address the challenge of increasingly antibiotic-resistant bacteria, and the rise in health care acquired infections. The Health and Social Care Act 2008 (updated 2011) introduces the Code of Practice for the Prevention and Control of HealthCare Associated Infections, also known as the Hygiene Code. This Code requires all health care organisations to have a policy in place on antimicrobial prescribing, in order to reduce the incidence an*d prevalence of Health Care Associated Infections (HCAI). Where possible, treatment is based on national guidance (Public Health England: Management of infection guidance for primary care for consultation and local adaptation). Local adaptation has been applied where required on advice of the local acute trusts department of infection, based on local sensitivities and resistance patterns.

Infections account for a large proportion of the acute workload seen in general practice and cause considerable patient distress. The prescriber is sometimes put under pressure to prescribe by patients who perceive that antibiotics will provide quick resolution, particularly if they are under pressure to return to work.

However, the evidence to support antibiotic treatment is often weak or lacking, and certain illnesses can be self-limiting. Good communication between the prescriber and patient, with adequate time given to the consultation, is known to bring about more selective and appropriate prescribing

Aims and Objectives of the Guidance

The aims are to:

- Support the rational, safe and cost-effective use of antibiotics by selecting the best approach to managing common infections from the evidence available.
- Promote the selective use of antibiotics to reduce the emergence of antimicrobial resistance in the community.
- Empower patients with information and support mechanisms so they can cope with their infection.

The objectives are to:

- Assist prescribers in managing individuals with infections by providing clear information on the likely clinical outcome with or without treatment and to indicate possible risk.
- Help the prescriber decide whether or not antibiotic treatment is indicated and which antibiotic is the most appropriate.

This guidance should always be applied in conjunction with clinical judgement and consideration of important individual case factors including allergy, pregnancy, drug interactions and drug safety advice from the MHRA. The recommendations apply only in the absence of contra- indications. Please refer to the latest BNF, BNFc or Summary of Product Characteristics (SmPC) for further information

Antimicrobial prescribing guidance – managing common infections

- For all PHE guidance, follow PHE's principles of treatment
- See BNF for appropriate use and dosing in specific populations, for example, hepatic impairment, renal impairment, pregnancy and breastfeeding.

Key		
	 	**Click symbols to access doses for children**
		**Click to access NICE's printable visual summary**

The strength of each PHE recommendation is qualified by a letter in parenthesis. This is an altered version of the grading recommendation system used by SIGN

STUDY DESIGN	RECOMMENDATION GRADE
Good recent systematic review and meta-analysis of studies	A+
One or more rigorous studies; randomised controlled trials	A-
One or more prospective studies	B+
One or more retrospective studies	B-
Non-analytic studies, for example case reports or case series	C
Formal combination of expert opinion	D

Abbreviations

BD, twice a day; eGFR, estimated glomerular filtration rate; IM, intramuscular; IV, intravenous; MALToma, mucosa-associated lymphoid tissue lymphoma; m/r, modified release; MRSA, methicillin-resistant *Staphylococcus aureus*; MSM, men who have sex with men; stat, given immediately; OD, once daily; TDS, 3 times a day; QDS, 4 times a day.

Treating Penicillin-allergic Patients:

These Antibiotic Guidelines contain alternative empirical treatment options for indications in which penicillins are the first-line choice. The table below illustrates the Antibiotic allergy traffic light system, which is employed throughout these guidelines (please note this list is not exhaustive).

Contra-indicated

Antibiotics to be avoided in penicillin allergy:

- Amoxicillin
- Ampicillin (in Co-fluampicil)
- Benzylpenicillin/Penicillin G
- Co-amoxiclav
- Flucloxicillin (in Co-fluampicil)
- Phenoxymethylpenicillin/Penicillin V
- Piperacillin (in Tazocin)
- Pivmecillinam
- Ticarcillin (in Timentin)

Caution

Avoid if serious Type 1 penicillin allergy (e.g.anaphylaxis / angiodema)

Use with caution if non-severe allergy (e.g. minor rash)

- Cephalosporins: Cefaclor, Cefadroxil, Cefalexin, Cefixime, Cefotaxime, Cefpirome, Cefpodoxime, Cefprozil, Cefrandine, Ceftazidime, Ceftriaxone, Cefuroxime
- Other Beta-lactam antibiotics: Aztreonam, Imipenem, meropenem, ertapenem
- Note: risk of allergic reaction is greater in β-lactams most similar to penicillin's in underlying structure

Considered Safe

- Amikacin
- Ciprofloxacin
- Clarithromycin
- Clindamycin
- Colistin
- Co-trimoxazole
- Doxycycline
- Erythromycin
- Gentamicin
- Linezolid
- Metronidazole
- Nitrofurantoin
- Minocycline
- Rifampicin
- Sodium fusidate
- Teicoplanin
- Tetracycline
- Tobramycin
- Trimethoprim
- Vancomycin

Infection	Key points	Medicine	Doses		Length	Visual summary
			Adult	Child		
▼ Upper respiratory tract infections						
Acute sore throat NICE Public Health England Last updated: Feb 2023	Advise to purchase OTC, paracetamol, or if preferred and suitable, ibuprofen for pain. OTC Medicated lozenges may help pain in adults. Use **FeverPAIN** or **Centor** to assess symptoms: **FeverPAIN 0-1 or Centor 0-2**: no antibiotic; **FeverPAIN 2-3**: no or back-up antibiotic; **FeverPAIN 4-5 or Centor 3-4:** immediate or back-up antibiotic. **Systemically very unwell or high risk of complications:** immediate antibiotic. Avoid broader-spectrum penicillins (e.g. **amoxicillin**) for the empirical treatment of sore throat. *5 days of **phenoxymethylpenicillin** may be enough for symptomatic cure; but a 10-day course may increase the chance of microbiological cure. *For detailed information click the visual summary icon.*	**First choice**: **phenoxymethylpenicillin** **Penicillin allergy**: **clarithromycin OR** **erythromycin** (preferred if pregnant) (**erythromycin** or **clarithromycin** only needed for 5 days as they have a broader spectrum of activity than **phenoxymethylpenicillin** and more likely to drive bacterial resistance)	500mg QDS or 1000mg BD 250mg to 500mg BD 250mg to 500mg QDS or 500mg to 1000mg BD		5 to 10* days 5 days 5 days	Influenza Public Health England Last updated: Feb 2019	**Annual vaccination is essential for all those 'at risk' of influenza.**[1D] Antivirals are not recommended for healthy adults.[1D,2A+] Treat 'at risk' patients with 5 days oseltamivir 75mg BD,[1D] when influenza is circulating in the community, and ideally within 48 hours of onset (36 hours for zanamivir treatment in children),[1D,3D] or in a care home where influenza is likely.[1D,2A+] **At risk**: pregnant (and up to 2 weeks post-partum); children under 6 months; adults 65 years or older; chronic respiratory disease (including COPD and asthma); significant cardiovascular disease (not hypertension); severe immunosuppression; chronic neurological, renal or liver disease; diabetes mellitus; morbid obesity (BMI>40).[4D] See the PHE Influenza guidance for the treatment of patients under 13 years.[4D] In severe immunosuppression, or oseltamivir resistance, use zanamivir 10mg BD[5A+,6A+] (2 inhalations twice daily by diskhaler for up to 10 days) and seek advice.[4D] *Access supporting evidence and rationales on the PHE website.*					
Scarlet fever (GAS) Public Health England Last updated: Feb 2023	Guidance is available from appendix 1 of the UKHSA guidelines for the public health management of scarlet fever outbreaks in schools, nurseries and other childcare settings. Scarlet fever is a notifiable disease, health professionals must inform local health protection teams of suspected cases. **North East and North Central London Health Protection Team (NENCLHPT) numbers:** • Daytime Tel: **020 3837 7084 (option 2 for healthcare professionals)** • **For Out of Hours Advice**: Tel: **0151 909 1215** (between 5pm and 9am and during weekends and Bank Holidays) Email: necl.team@ukhsa.gov.uk ; phe.nenclhpt@nhs.net **(if Personal Identifiable Information (PII) being included)**					

Infection	Key points	Medicine	Doses		Length	Visual summary
			Adult	Child		
Acute otitis media NICE Public Health England Last updated: Mar 2022	Regular paracetamol or ibuprofen for pain (right dose for age or weight at the right time and maximum doses for severe pain). Consider ear drops containing an anaesthetic and an analgesic (**Otigo (lidocaine hydrochloride, phenazone**) 40 mg/10 mg/g) for pain if an immediate antibiotic is not given and there is no ear drum perforation or otorrhoea. **Otorrhoea or under 2 years with infection in both ears**: no, back-up or immediate antibiotic. **Otherwise**: no or back-up antibiotic. **Systemically very unwell or high risk of complications**: immediate antibiotic. *For detailed information click on the visual summary.*	**First choice**: **amoxicillin**	-		5 to 7 days			Penicillin allergy: **clarithromycin OR**	-		5 to 7 days	
		erythromycin (if macrolide needed in pregnancy; consider benefit/harm)	-			
		Second choice: **co-amoxiclav**	-		5 to 7 days	
Acute otitis externa Public Health England Last updated: Nov 2017	**First line**: Advise to purchase OTC analgesia for pain relief,[1D,2D] and apply localised heat (such as a warm flannel).[2D] **Second line**: OTC topical acetic acid (>12yrs) e.g. EarCalm spray OR topical antibiotic +/- steroid e.g. betamethasone 0.1% neomycin (Betnesol N drops) or Otomize Spray: similar cure at 7 days.[2D,3A+,4B-] **If cellulitis or disease extends outside ear canal**, or systemic signs of infection, swab ear, start oral flucloxacillin and refer to exclude malignant otitis externa.[1D]	**Second line**: OTC (>12yrs) topical **acetic acid** 2%[2D,4B-] **OR**	1 spray TDS[5A-]	BNF for children	7 days[5A]	*Not available. Access supporting evidence and rationales on the PHE website*
		topical **neomycin sulphate** with corticosteroid[2D,5A-] (consider safety issues if perforated tympanic membrane)[6B-]	3 drops TDS[5A-]	BNF for children	7 days (min) to 14 days (max)[3A+]	
		If cellulitis: **flucloxacillin**[7B+]	250mg QDS[2D]	BNF for children	7 days[2D]	
			If severe: 500mg QDS[2D]			
Sinusitis NICE	Advise to purchase OTC paracetamol or ibuprofen for pain. Little evidence that nasal saline or nasal decongestants help, but people may want to try them OTC. **Symptoms for 10 days or less**: no antibiotic. **Symptoms with no improvement for more than 10 days**: no antibiotic or back-up antibiotic depending on likelihood of bacterial cause.	**First choice**: **phenoxymethylpenicillin**	500mg QDS		5 days	
		Penicillin allergy: **doxycycline** (not in under 12s) **OR**	200mg on day 1, then 100mg OD		5 days	
		clarithromycin OR	500mg BD			

Infection	Key points	Medicine	Doses		Length	Visual summary
			Adult	Child		
Public Health England Last updated: Oct 2017	Consider high-dose nasal corticosteroid (if over 12 years). **Systemically very unwell or high risk of complications**: immediate antibiotic. *For detailed information click on the visual summary.*	**erythromycin** (preferred if pregnant)	250 to 500mg QDS or 500 to 1000mg BD			
		Second choice or first choice if systemically very unwell or high risk of complications: **co-amoxiclav**	500/125mg TDS		5 days	

▼ Lower respiratory tract infections

COVID-19 NICE **Last updated: November 2021**	Antibiotics should not be used for preventing or treating COVID-19 unless there is clinical suspicion of additional bacterial co-infection. See the section on suspected or confirmed co-infection. **Do not use azithromycin** to treat COVID-19. **Do not use doxycycline** to treat COVID-19 in the community. **Do not offer** an antibiotic for preventing secondary bacterial pneumonia in people with COVID-19. If a person in the community has suspected or confirmed secondary bacterial pneumonia, start antibiotic treatment as soon as possible, see community-acquired pneumonia for choices. In hospital, start empirical antibiotics if there is clinical suspicion of a secondary bacterial infection in people with COVID-19, see hospital-acquired pneumonia for choices. Start antibiotics as soon as possible after establishing a diagnosis of secondary bacterial pneumonia, and certainly within 4 hours. Start treatment within 1 hour if the person has suspected sepsis and meets any of the high-risk criteria for this outlined in the NICE guideline on sepsis. For detailed information, see the NICE guideline on managing COVID-19.					
Acute exacerbation of COPD NICE Public Health England Last updated: Dec 2018	Many exacerbations are not caused by bacterial infections so will not respond to antibiotics. Consider an antibiotic, but only after considering severity of symptoms (particularly sputum colour changes and increases in volume or thickness), need for hospitalisation, previous exacerbations, hospitalisations and risk of complications, previous sputum culture and susceptibility results, and risk of resistance with repeated courses. Some people at risk of exacerbations may have antibiotics to keep at home as part of their exacerbation action plan. *For detailed information click on the visual summary. See also the NICE guideline on COPD in over 16s.*	**First choice:** **amoxicillin OR**	500mg TDS (see BNF for severe infection)	-	5 days			doxycycline OR	200mg on day 1, then 100mg OD (see BNF for severe infection)	-		
		clarithromycin	500mg BD	-		
		Second choice: use alternative first choice				
		Alternative choice (if person at higher risk of treatment failure): **co-amoxiclav OR**	500/125mg TDS	-	5 days	
		co-trimoxazole OR	960mg BD	-		

Infection	Key points	Medicine	Doses		Length	Visual summary
			Adult	Child		
Acute exacerbation of COPD cont…		**levofloxacin** (with specialist advice if **co-amoxiclav** or **co-trimoxazole** cannot be used; consider safety issues)	500mg OD	-		
		IV antibiotics *(specialist only)*				
Acute exacerbation of bronchiectasis (non-cystic fibrosis) NICE Public Health England Last updated: Dec 2018	Send a sputum sample for culture and susceptibility testing. Offer an antibiotic. When choosing an antibiotic, take account of severity of symptoms and risk of treatment failure. People who may be at higher risk of treatment failure include people who've had repeated courses of antibiotics, a previous sputum culture with resistant or atypical bacteria, or a higher risk of developing complications. Course length is based on severity of bronchiectasis, exacerbation history, severity of exacerbation symptoms, previous culture and susceptibility results, and response to treatment. Do not routinely offer antibiotic prophylaxis to prevent exacerbations. Seek specialist advice for preventing exacerbations in people with repeated acute exacerbations. This may include a trial of antibiotic prophylaxis after a discussion of the possible benefits and harms, and the need for regular review. *For detailed information click on the visual summary.*	**First choice empirical treatment:** **amoxicillin** (preferred if pregnant) **OR**	500mg TDS		7 to 14 days	
		doxycycline (not in under 12s) **OR**	200mg on day 1, then 100mg OD			
		clarithromycin	500mg BD			
		Alternative choice (if person at higher risk of treatment failure) empirical treatment: **co-amoxiclav OR**	500/125mg TDS		7 to 14 days	
		levofloxacin (adults only: with specialist advice if **co-amoxiclav** cannot be used; consider safety issues) **OR**	500mg OD or BD			
		ciprofloxacin (children only: with specialist advice if **co-amoxiclav** cannot be used; consider safety issues)	-			
		IV antibiotics *(specialist only)*				
		When current susceptibility data available: choose antibiotics accordingly				

Infection	Key points	Medicine	Doses		Length	Visual summary
			Adult	Child		
Acute Cough **NICE** **Last updated: Feb 2019**	Some people may wish to try honey (in over 1s), the herbal medicine pelargonium (in over 12s), cough medicines containing the expectorant guaifenesin (in over 12s) or cough medicines containing cough suppressants, except codeine, (in over 12s). These self-care treatments have limited evidence for the relief of cough symptoms and should be advised to be purchase OTC. **Acute cough with upper respiratory tract infection**: no antibiotic. **Acute bronchitis**: no routine antibiotic. **Acute cough and higher risk of complications (at face-to-face examination/remote examination)**: immediate or back-up antibiotic. **Acute cough and systemically very unwell (at face to face examination/remote examination)**: immediate antibiotic. Higher risk of complications includes people with pre-existing comorbidity; young children born prematurely; people over 65 with 2 or more of, or over 80 with 1 or more of: hospitalisation in previous year, type 1 or 2 diabetes, history of congestive heart failure, current use of oral corticosteroids. Do not offer a mucolytic, an oral or inhaled bronchodilator, or an oral or inhaled corticosteroid unless otherwise indicated. *For detailed information click on the visual summary. See also the NICE guideline on pneumonia for prescribing antibiotics in adults with acute bronchitis who have had a C-reactive protein (CRP) test (CRP<20mg/l: no routine antibiotic, CRP 20 to 100mg/l: back-up antibiotic, CRP>100mg/l: immediate antibiotic).*	**Adults first choice (if indicated):** **doxycycline**	200mg on day 1, then 100mg OD	-	5 days			Adults alternative first choices: **amoxicillin** (preferred if pregnant) **OR**	500mg TDS	-		
		clarithromycin OR	250mg to 500mg BD	-		
		erythromycin (preferred if pregnant)	250mg to 500mg QDS or 500mg to 1000mg BD	-		
		Children first choice (if indicated): **amoxicillin**	-		5 days	
		Children alternative first choices: **clarithromycin OR**	-			
		erythromycin OR	-			
		doxycycline (not in under 12s)	-

			Adult	Child		
Community-acquired pneumonia NICE Public Health England Last updated: Sept 2019	Assess severity in adults based on clinical judgement guided by mortality risk score (CRB65 or CURB65). See the NICE guideline on pneumonia for full details: **low severity** – CRB65 0 or CURB65 0 or 1 **moderate severity** – CRB65 1 or 2 or CURB65 2 **high severity** – CRB65 3 or 4 or CURB65 3 to 5. Each CRB65 parameter scores one: • Confusion (AMT<8, or new disorientation in person, place or time) • Respiratory rate >30/min; • BP systolic <90 or diastolic ≤ 60; • Age > 65 Assess severity in children based on clinical judgement. Offer an antibiotic. Start treatment as soon as possible after diagnosis, within 4 hours (within 1 hour if sepsis suspected and person meets any high-risk criteria – see the NICE guideline on sepsis). When choosing an antibiotic, take account of severity, risk of complications, local antimicrobial resistance and surveillance data, recent antibiotic use and microbiological results. * Stop antibiotics after 5 days unless microbiological results suggest a longer course is needed or the person is not clinically stable. *For detailed information click on the visual summary. See also the NICE guideline on pneumonia.*	**First choice (low severity in adults or non-severe in children): amoxicillin**	500mg TDS (higher doses can be used, see BNF)		5 days*			Alternative first choice (low severity in adults or non-severe in children): doxycycline (not in under 12s) **OR**	200mg on day 1, then 100mg OD			
		clarithromycin OR	500mg BD			
		erythromycin (in pregnancy)	500mg QDS			
		First choice (moderate severity in adults): amoxicillin AND (if atypical pathogens suspected)	500mg TDS (higher doses can be used, see BNF)	-	5 days*	
		clarithromycin OR	500mg BD	-		
		erythromycin (in pregnancy)	500mg QDS	-		
		Alternative first choice (moderate severity in adults): doxycycline OR	200mg on day 1, then 100mg OD	-		
		clarithromycin	500mg BD	-		
		First choice (high severity in adults or severe in children): co-amoxiclav AND (if atypical pathogens suspected)	500/125mg TDS		5 days*	
		clarithromycin OR	500mg BD			
		erythromycin (in pregnancy)	500mg QDS			
		Alternative first choice (high severity in adults): levofloxacin (consider safety issues)	500mg BD	-		
		IV antibiotics *(specialist only)*

			Adult	Child		
Catheter-associated urinary tract infection NICE Public Health England	Antibiotic treatment is not routinely needed for asymptomatic bacteriuria in people with a urinary catheter. Consider removing or, if not possible, changing the catheter if it has been in place for more than 7 days. But do not delay antibiotic treatment if it is indicated. Advise to purchase OTC paracetamol for pain. Advise drinking enough fluids to avoid dehydration. Offer an antibiotic for a symptomatic infection. When prescribing antibiotics, take account of severity of symptoms, risk of complications, previous urine culture and susceptibility results, previous antibiotic use which may have led to resistant bacteria and local antimicrobial resistance data. Do not routinely offer antibiotic prophylaxis to people with a short-term or long-term catheter. *For detailed information click on the visual summary. See also the Public Health England urinary tract infection: diagnostic tools for primary care.* See Nitrofurantoin Safety Alert:	**Non-pregnant women and men first choice if no upper UTI symptoms:** **nitrofurantoin** (if eGFR ≥45 ml/minute) **OR**	100mg m/r BD (or if unavailable 50mg QDS)	-	7 days	
		trimethoprim (if low risk of resistance) **OR**	200mg BD	-		
		amoxicillin (only if culture results available and susceptible)	500mg TDS	-

Clostridioides difficile infection NICE Public Health England Last updated: Jul 2021	For suspected or confirmed *C. difficile* infection, see Public Health England's guidance on diagnosis and reporting. **Assess**: whether it is a first or further episode, severity of infection, individual risk factors for complications or recurrence (such as age, frailty or comorbidities). **Existing antibiotics**: review and stop unless essential. If still essential, consider changing to one with a lower risk of *C. difficile* infection. Review the need to continue: proton pump inhibitors, other medicines with gastrointestinal activity or adverse effects (such as laxatives), medicines that may cause problems if people are dehydrated (such as NSAIDs). Do not offer antimotility medicines such as loperamide. Offer an oral antibiotic to treat suspected or confirmed *C. difficile* infection. For adults, consider seeking prompt specialist advice from a microbiologist or infectious diseases specialist before starting treatment. For children and young people, treatment should be started by, or after advice from, a microbiologist, paediatric infectious diseases specialist or paediatric gastroenterologist. **If antibiotics have been started for suspected *C. difficile* infection, and subsequent stool sample tests do not confirm infection, consider stopping these antibiotics.** *For detailed information click on the visual summary*	**First-line for first episode of mild, moderate or severe:** **vancomycin**	125mg QDS	BNF for children	10 days	
		Second-line for first episode of mild, moderate or severe if vancomycin ineffective: **fidaxomicin**	200mg BD	BNF for children		
		For further episode within 12 weeks of symptom resolution (relapse): **fidaxomicin**	200mg BD	BNF for children		
		For further episode more than 12 weeks after symptom resolution (recurrence): **vancomycin OR**	125mg QDS	BNF for children		
		fidaxomicin	200mg BD	BNF for children		
		For alternative antibiotics if first- and second-line antibiotics are ineffective or for life-threatening infection seek specialist advice (see visual summary)

Cold sores Public Health England Last updated: Nov 2017	**Most resolve after 5 days without treatment**.[1A-,2A-] Topical OTC antivirals applied prodromally can reduce duration by 12 to 18 hours.[1A-,2A-,3A-] **If frequent, severe, and predictable triggers**: consider oral prophylaxis:[4D,5A+] **aciclovir** 400mg, twice daily, for 5 to 7 days.[5A+,6A+] *Access supporting evidence and rationales on the PHE website*					
PVL-SA Public Health England Last updated: Nov 2017	Panton-Valentine leukocidin (PVL) is a toxin produced by 20.8 to 46% of *S. aureus* from boils/abscesses.[1B+,2B+,3B-] PVL strains are rare in healthy people, but severe.[2B+] **Suppression therapy** should only be started after primary infection has resolved, as ineffective if lesions are still leaking.[4D] **Risk factors for PVL**: recurrent skin infections;[2B+] invasive infections;[2B+] MSM;[3B-] if there is more than one case in a home or close community[2B+,3B-] (school children;[3B-] military personnel;[3B-] nursing home residents;[3B-] household contacts).[3B-] Consider taking a swab of pus from the contents of the lesion if the boil or carbuncle is: • Not responding to treatment, persistent or recurrent, to exclude atypical mycobacteria or PVL-SA. • There are multiple lesions. • The person: Is immunocompromised, is known to be colonized with MRSA, Has diabetes. • If PVL-SA is suspected, this should be mentioned specifically on the laboratory form **If positive PVL MRSA or positive *S. aureus* contact the North East and North Central London Health Protection Team (NENCLHPT) contact numbers:** • Daytime Tel: **020 3837 7084 (option 2)** • **For Out of Hours Advice**: Tel: **0151 909 1215** (between 5pm and 9am and during weekends and Bank Holidays) • Email: necl.team@phe.gov.uk ; phe.nenclhpt@nhs.net *Access the supporting evidence and rationales on the PHE website.*					
Leg ulcer NICE Last updated: Feb 2020	Manage any underlying conditions to promote ulcer healing. Only offer an antibiotic when there are symptoms or signs of infection (such as redness or swelling spreading beyond the ulcer, localised warmth, increased pain or fever). Few leg ulcers are clinically infected but most are colonised by bacteria. When prescribing antibiotics, take account of severity, risk of complications and previous antibiotic use. *For detailed information click on the visual summary.*	**First-choice:**				
		flucloxacillin	500mg to 1g QDS	-	7 days	
		Penicillin allergy or if flucloxacillin unsuitable:				
		doxycycline OR	200mg on day 1, then 100mg OD (can be increased to 200mg daily)	-	7 Days	
		clarithromycin OR	500mg BD			
		erythromycin (in pregnancy)	500mg QDS			
		Second choice:				
		co-amoxiclav OR	500/125mg TDS	-	7 Days	
		co-trimoxazole (in penicillin allergy)	960mg BD			

Infection	Key points	Medicine	Doses		Length	Visual summary
			Adult	Child		
		For antibiotic choices if severely unwell or MRSA suspected or confirmed, click on the visual summary				
Cellulitis and erysipelas NICE Public Health England Last updated: Sept 2019	Exclude other causes of skin redness (inflammatory reactions or non-infectious causes). Consider marking extent of infection with a single-use surgical marker pen. Offer an antibiotic. Take account of severity, site of infection, risk of uncommon pathogens, any microbiological results and MRSA status. Infection around eyes or nose is more concerning because of serious intracranial complications. *A longer course (up to 14 days in total) may be needed but skin takes time to return to normal, and full resolution at 5 to 7 days is not expected. Do not routinely offer antibiotics to prevent recurrent cellulitis or erysipelas. *For detailed information click on the visual summary.*	**First choice:**				
		flucloxacillin	500mg to 1g QDS		5 to 7 days*	
		Penicillin allergy or if flucloxacillin unsuitable:				
		clarithromycin (inc children with penicillin allergy) **OR**	500mg BD		5 to 7 days*	
		erythromycin (in pregnancy) **OR**	500mg QDS			
		doxycycline (adults only) **OR**	200mg on day 1, then 100mg OD	-		
		co-amoxiclav (children only: not in penicillin allergy)	-			
		If infection near eyes or nose:				
		co-amoxiclav	500/125mg TDS		7 days*	
		If infection near eyes or nose (penicillin allergy):				
		clarithromycin AND	500mg BD		7 days*	
		metronidazole (only add in children if anaerobes suspected)	400mg TDS			
		For alternative choice antibiotics for severe infection, suspected or confirmed MRSA infection and IV antibiotics *(specialist only)* **click on the visual summary**				
Eczema (bacterial infection) NICE	Manage underlying eczema and flares with treatments such as emollients and topical corticosteroids, whether antibiotics are given or not. Symptoms and signs of secondary bacterial infection can include: weeping, pustules, crusts, no response to treatment, rapidly worsening eczema, fever and malaise.	**If not systemically unwell, do not routinely offer either a topical or oral antibiotic**				
		Topical antibiotic (if a topical is appropriate). For localised infections only:				
		First choice: **fusidic acid** 2%	TDS		5 to 7 days	
		Oral antibiotic (if oral is appropriate):				
		First choice: **flucloxacillin**	500mg QDS		5 to 7 days	

Infection	Key points	Medicine	Doses		Length	Visual summary
			Adult	Child		
Public Health England Last updated: Mar 2021 **Eczema (bacterial infection) cont** NICE Public Health England Last updated: Mar 2021	Not all flares are caused by a bacterial infection, so will not respond to antibiotics. Eczema is often colonised with bacteria but may not be clinically infected. Do not routinely take a skin swab. **Not systemically unwell:** Do not routinely offer either a topical or oral antibiotic. If an antibiotic is offered, when choosing between a topical or oral antibiotic, take account of patient preferences, extent and severity of symptoms or signs, possible adverse effects, and previous use of topical antibiotics because antimicrobial resistance can develop rapidly with extended or repeated use. **Systemically unwell:** Offer an oral antibiotic. If there are symptoms or signs of cellulitis, see cellulitis and erysipelas. *For detailed information click on the visual summary.*	**Penicillin allergy or flucloxacillin unsuitable: clarithromycin OR**	250mg BD (can be increased to 500mg BD for severe infections)			
		erythromycin (in pregnancy)	250mg to 500mg QDS			
		If MRSA suspected or confirmed – consult local microbiologist				
Diabetic foot infection NICE	In diabetes, all foot wounds are likely to be colonised with bacteria. Diabetic foot infection has at least 2 of: local swelling or induration; erythema; local tenderness or pain; local warmth; purulent discharge. Severity is classified as: **Mild**: local infection with 0.5 to less than 2cm erythema	**Mild infection: first choice**				
		flucloxacillin	500mg to 1g QDS	-	7 days*	
		Mild infection (penicillin allergy):				
		clarithromycin OR	500mg BD			
		erythromycin (in pregnancy) **OR**	500mg QDS			
		doxycycline	200mg on day 1, then 100mg OD (can be increased to 200mg daily)	-	7 days*	
Infection	Key points	Medicine	Doses		Length	Visual summary
			Adult	Child		
Diabetic foot infection cont.. Last updated: Oct 2019	**Moderate**: local infection with more than 2cm erythema or involving deeper structures (such as abscess, osteomyelitis, septic arthritis or fasciitis) **Severe**: local infection with signs of a systemic inflammatory response. Start antibiotic treatment as soon as possible. Take samples for microbiological testing before, or as close as possible to, the start of treatment When choosing an antibiotic, take account of severity, risk of complications, previous microbiological results and antibiotic use, and patient preference. *A longer course (up to a further 7 days) may be needed based on clinical assessment. However, skin does take time to return to normal, and full resolution at 7 days is not expected. Do not offer antibiotics to prevent diabetic foot infection. *For detailed information click on the visual summary.*	**For antibiotic choices for moderate or severe infection, infections where *Pseudomonas aeruginosa* or MRSA is suspected or confirmed, and IV antibiotics** *(specialist only)* **click on the visual summary**				
Scabies Public Health England Last updated: Oct 2020	**First choice OTC permethrin**: Treat whole body from ear/chin downwards,[1D,2D] and under nails.[1D,2D] **If using permethrin** and patient is under 2 years, elderly or immunosuppressed, or **if treating with malathion**: also treat face and scalp.[1D,2D] **Home/sexual contacts**: treat within 24 hours.[1D]	OTC **permethrin** (>2yrs) [1D,2D,3A+]	5% cream[1D,2D]	BNF for children	2 applications, 1-week apart[1D]	*Not available. Access supporting evidence and rationales on the PHE website*
		Permethrin allergy: **malathion**[1D]	0.5% aqueous liquid[1D]	BNF for children		
Human and animal bites NICE Public Health England	Offer an antibiotic for a human or animal bite if there are symptoms or signs of infection, such as increased pain, inflammation, fever, discharge or an unpleasant smell. Take a swab for microbiological testing if there is discharge (purulent or non-purulent) from the wound. Do not offer antibiotic prophylaxis if a human or animal bite has not broken the skin.	**First choice:**						co-amoxiclav	250/125mg or 500/125mg TDS		3 days for prophylaxis 5 days for treatment*	
		Penicillin allergy or co-amoxiclav unsuitable:				
		doxycycline AND	200mg on day 1, then 100mg or 200mg daily		3 days for prophylaxis 5 days for treatment*	
		metronidazole	400mg TDS			

Infection	Key points	Medicine	Doses		Length	Visual summary
			Adult	Child		
		seek specialist advice in pregnancy				
Last updated: Nov 2020	**Human bite:** Offer antibiotic prophylaxis if the human bite has broken the skin and drawn blood. Consider antibiotic prophylaxis if the human bite has broken the skin but not drawn blood if it is in a high-risk area or person at high risk. **Cat bite:** Offer antibiotic prophylaxis if the cat bite has broken the skin and drawn blood. Consider antibiotic prophylaxis if the cat bite has broken the skin but not drawn blood if the wound could be deep. **Dog or other traditional pet bite (excluding cat bite)** Do not offer antibiotic prophylaxis if the bite has broken the skin but not drawn blood. Offer antibiotic prophylaxis if the bite has broken the skin and drawn blood if it has caused considerable, deep tissue damage or is visibly contaminated (for example, with dirt or a tooth). Consider antibiotic prophylaxis if the bite has broken the skin and drawn blood if it is in a high-risk area or person at high risk. *course length can be increased to 7 days (with review) based on clinical assessment of the wound.	**IV antibiotics** *(specialist only)*				

Infection	Key points	Medicine	Doses		Length	Visual summary
			Adult	Child		
Insect bites and stings NICE Last updated: Sept 2020	An insect bite or sting often causes a small, red lump on the skin, which may be painful and itchy. Secondary bacterial infection is unlikely; it is unclear which causative organisms are most common. **Do not offer an antibiotic if there are no symptoms or signs of infection.** With rapid-onset skin reactions likely to be inflammatory or allergic reactions, most bites and stings will not need antibiotics. The guideline notes people may wish to consider oral antihistamines (OTC) to help relieve itching (which may last up to 10 days), and some antihistamines cause sedation, which might help at night. For bites and stings where there is a sign of an infection, antibiotic treatment recommendations in the NICE guideline on cellulitis and erysipelas should be followed, or the guidance on Lyme disease if there is a known or suspected tick bite.					Mastitis Public Health England Last updated: Nov 2017	*S. aureus* is the most common infecting pathogen.[1D] Suspect if woman has: a painful breast;[2D] fever and/or general malaise;[2D] a tender, red breast.[2D] **Breastfeeding**: oral antibiotics are appropriate, where indicated.[2D,3A+] Women should continue feeding,[1D,2D] including from the affected breast.[2D]	**For lactating woman:** flucloxacillin[2D]	500mg QDS[2D]	-	10 to 14 days[2D]	*Not available. Access supporting evidence and rationales on the PHE website*
		If penicillin allergy: erythromycin[2D] **OR**	250mg to 500mg QDS[2D]			
		clarithromycin[2D]	500mg BD[2D]			
		For non-lactating woman (NICE CKS): co-amoxiclav	625mg TDS			
		If penicillin allergy (NICE CKS): Metronidazole **AND**	500mg TDS			
		Erythromycin **OR**	250mg to 500mg QDS			
		clarithromycin	500mg BD			
Dermatophyte infection: skin Public Health England Last updated: Feb 2019	**Dermatophyte infection: skin** Including: Tinea corporis (ringworm) Tinea pedis (athlete's foot), Tinea cruris (jock itch) Tinea faciei (facial ringworm), Tinea capitis (scalp ringworm) **Most cases**: use terbinafine as fungicidal, treatment time shorter and more effective than with fungistatic imidazoles or undecenoates [1D,2A+] If candida possible, use imidazole.[4D] **If intractable, or scalp**: send skin scrapings,[1D] and if infection confirmed: use oral terbinafine[1D,3A+,4D] or itraconazole.[2A+,3A+,5D] **Scalp**: oral therapy,[6D] and discuss with specialist.[1D]	topical terbinafine[3A+,4D] **OR**	1% OD to BD[2A+]	BNF for children	1 to 4 weeks[3A+]	*Not available. Access supporting evidence and rationales on the PHE website*
		topical clotrimazole [2A+,3A+]	1% OD to BD[2A+]	BNF for children	4 to 6 weeks[2A+,3A+]	
		Alternative in athlete's foot: topical undecenoates[2A+] (such as Mycota®)[2A+]	OD to BD[2A+]	BNF for children		

Infection	Key points	Medicine	Doses		Length	Visual summary
			Adult	Child		
Dermatophyte infection: nail Public Health England Last updated: Oct 2018	**Take nail clippings**;[1D] start therapy only if infection is confirmed.[1D] Oral **terbinafine** is more effective than oral azole.[1D,2A+,3A+,4D] Liver reactions 0.1 to 1% with oral antifungals.[3A+] If candida or non-dermatophyte infection is confirmed, use oral **itraconazole**.[1D,3A+,4D] Topical nail lacquer is not as effective.[1D,5A+,6D] **To prevent recurrence**: apply weekly 1% topical antifungal cream to entire toe area.[6D] **Children**: seek specialist advice.[4D]	**First line**: **terbinafine**[1D,2A+,3A+,4D,6D]	250mg OD[1D,2A+,6D]	BNF for children	Fingers: 6 weeks[1D,6D] to 3 months (NICE CKS) Toes: 12 weeks[1D,6D] to 6 months (NICE CKS)	*Not available. Access supporting evidence and rationales on the PHE website*
		Second line: **itraconazole**[1D,3A+,4D,6D]	200mg BD[1D,4D]	BNF for children	1 week repeated after 21 days Fingers: 2 courses[1D] Toes: 3 courses[1D]	
		Stop treatment when continual, new, healthy, proximal nail growth.[6D]				
Varicella zoster/ chickenpox **Herpes zoster/ shingles** Public Health England Last updated: Oct 2018	**Pregnant/immunocompromised/ neonate/Breastfeeding**: seek urgent specialist advice.[1D] **Chickenpox**: consider **aciclovir**[2A+,3A+,4D] if: onset of rash <24 hours,[3A+] and 1 of the following: >14 years of age;[4D] severe pain;[4D] dense/oral rash;[4D,5B+] taking steroids;[4D] smoker.[4D,5B+] Advice to purchase OTC paracetamol for pain relief.[6C] **Shingles**: treat if >50 years[7A+,8D] (PHN rare if <50 years)[9B+] and within 72 hours of rash,[10A+] or if 1 of the following: active ophthalmic;[11D] Ramsey Hunt;[4D] eczema;[4D] non-truncal involvement;[8D] moderate or severe pain;[8D] moderate or severe rash.[5B+,8D] Shingles treatment if not within 72 hours: consider starting antiviral drug up to 1 week after rash onset,[12B+] if high risk of severe shingles[12B+] or continued vesicle formation;[4D] older age;[7A+,8D,12B+] immunocompromised;[4D] or severe pain.[7D,11B+]	**First line for chicken pox and shingles**: **aciclovir**[3A+,7A+,10A+,13B+,14A-,15A+]	800mg 5 times daily[16A-]	BNF for children	7 days[14A-,16A-]	*Not available. Access supporting evidence and rationales on the PHE website*
		Second line for shingles if poor compliance: *not for children:* **famciclovir**[8D,14A-, 16A-] *(specialist only)* **OR**	250mg to 500mg TDS[15A+] **OR** 750mg BD[15A+]	-		
		valaciclovir[8D,10A+,14A-] *(specialist only)*	1g TDS[14A-]	BNF for children

<tr><td rowspan="2">Tick bites (Lyme disease)
Public Health England

Last updated:
Feb 2020</td><td rowspan="2">Treatment: Treat erythema migrans empirically; serology is often negative early in infection.[1D]
For other suspected Lyme disease such as neuroborreliosis (CN palsy, radiculopathy) seek advice.[1D]
See NICE NG95 for full treatment doses/information</td><td>Treatment
doxycycline[1D]</td><td>100mg BD[1D]</td><td>BNF for children</td><td rowspan="2">21 days[1D]</td><td rowspan="2">See NICE NG95</td></tr>
<tr><td>Alternative:
amoxicillin[1D]</td><td>1,000mg TDS[1D]</td><td>BNF for children</td></tr>
<tr><td colspan="6">Be aware that:
• the bacteria that cause Lyme disease are transmitted by the bite of an infected tick
• ticks are mainly found in grassy and wooded areas, including urban gardens and parks
• tick bites may not always be noticed
• infected ticks are found throughout the UK and Ireland, and although some areas appear to have a higher prevalence of infected ticks, prevalence data are incomplete
particularly high-risk areas are the South of England and Scottish Highlands but infection can occur in many areas
• Lyme disease may be more prevalent in parts of central, eastern and northern Europe (including Scandinavia) and parts of Asia, the US and Canada.
Be aware that:
• most tick bites do not transmit Lyme disease and that prompt, correct removal of the tick reduces the risk of transmission.
Give people advice about:
• where ticks are commonly found (such as grassy and wooded areas, including urban gardens and parks)
• the importance of prompt, correct tick removal and how to do this (see the Public Health England website for information on removing ticks)
• covering exposed skin and using insect repellents that protect against ticks
• how to check themselves and their children for ticks on the skin
• sources of information on Lyme disease, such as Public Health England, and organisations providing information and support, such as patient charities.</td></tr>

- Safety-netting advice about when to re-consult

- **Self-care Leaflet**

The Managing Your Common Infection (Self-Care) leaflet can be used as a tool to increase patients' confidence and knowledge on how to self-care for their own infections thereby potentially reduce inappropriate antibiotic use.

- **UTI Leaflet - Women Under 65 Years**

The Treating Your Infection Urinary Tract Infection (TYI-UTI) patient information leaflet has been designed to be used with women under 65 years who are experiencing urinary symptoms suggesting uncomplicated UTIs

- **UTI Leaflet - Older Adults**

The Treating Your Infection Urinary Tract Infection (TYI-UTI) leaflet for older adults can be used either to provide information on UTIs to those at risk or care staff may wish to share this leaflet with older adults in their care and/or their relatives.

- **UTI Leaflet - Combined For Adults**

This leaflet contains information from our Treating Your Infection Urinary Tract Infection (TYI-UTI) leaflet for women under 65 years and UTI leaflet for older adults in an easily accessible booklet style format with icons and images.

- **RTI Leaflet**

The Treating Your Infection Respiratory Tract Infection (TYI-RTI) patient information leaflet has been designed to be used with patients who are experiencing self-limiting RTIs.

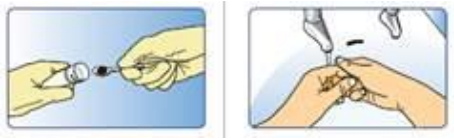
- **RTI Pictorial Leaflet**

The leaflet can be used to provide information on RTIs. It is pictorial and uses plain English so that it is suitable for a range of community groups.

- **RTI Leaflet - Other Settings**

These leaflets have been designed for use in the out of hours (OOH) and pharmacy settings.

4. Other useful leaflets (not developed by TARGET)



Public Health England Stool collection leaflet (click on the picture to download the leaflet)

The stool collection leaflet is a step-by-step guide illustrating how to collect a stool sample for microbiological examination.

Antibiotic guardian leaflet (click on the image to download the leaflet)

Part of the dental antimicrobial stewardship toolkit for primary care, this leaflet highlights why antibiotics don't cure toothache and provides safety netting advice.

When should I worry? Booklet for parents and carers (click on the image to download the booklet). For other languages please visit the When Should I Worry website.

The 'When Should I Worry?' booklet provides information for parents about the management of respiratory tract infections such as coughs, colds, sore throats and ear aches in children. It is designed to be shared in consultations.

Caring for children with coughs leaflet (click on the image to download the leaflet)

This leaflet was co-created by a diverse group of parents and University of Bristol researchers. It contains information addressing the four most common parental concerns for children with RTI with cough and safety-netting advice based on NICE guidelines. The leaflet was created under a creative commons licence (attribution) which means they can be used, reproduced and distributed by anyone as long as they are clearly attributed in any report or publication and cited as: Cabral, C. Ingram, J. Redmond, N. Horwood, J. Blair, P. Hollinghurst, S. Hay, A. Lucas P. 2016, 'Caring for children with coughs: Information and advice for parents'. University of Bristol, Bristol. Foreign language translation of this leaflet are available from the University of Bristol website.

Get well soon without antibiotics leaflet (click on the image to download the leaflet)

This leaflet, produced by the Department of Health, explains the need to get the right treatment for common illnesses such as colds and coughs without encouraging antibiotic resistance. It is available in different languages and is suitable for distribution in waiting areas.

Antibiotics Don't Cure Toothache (click on the image to download the leaflet)

Part of the dental antimicrobial stewardship toolkit for primary care, this leaflet highlights why antibiotics don't cure toothache and provides safety netting advice.

Notification of Diseases

Registered medical practitioners (RMPs) have a statutory duty to notify suspected cases of certain infectious diseases (listed below). These can be notified via the North East and North Central London Health Protection Team (NENCLHPT):

- Daytime Tel: **020 3837 7084 (option 2)**
- **For Out of Hours Advice**: Tel: **0151 909 1215** (between 5pm and 9am and during weekends and Bank Holidays)
- Email: necl.team@phe.gov.uk ; phe.nenclhpt@nhs.net

Notifiable diseases

Acute encephalitis	Malaria
Acute infectious hepatitis	Measles
Acute meningitis	Meningococcal septicaemia
Acute poliomyelitis	Mumps
Anthrax	Plague
Botulism	Rabies
Brucellosis	Rubella
Cholera	Severe Acute Respiratory Syndrome (SARS)
Diphtheria	Scarlet fever
Enteric fever (typhoid or paratyphoid fever)	Smallpox
Food poisoning	Tetanus
Haemolytic uraemic syndrome (HUS)	Tuberculosis
Infectious bloody diarrhoea	Typhus
Invasive group A streptococcal disease	Viral haemorrhagic fever (VHF)
Legionnaires' disease	Whooping cough
Leprosy	Yellow fever
