

*Universal Care Plan Data Exchange Communications for UCP users accessing from EMIS and TPP SystemOne Electronic Health Record systems - approved for distribution – 25<sup>th</sup> January 2024*

The [Universal Care Plan](#) (UCP), a personalised care planning application available across London, exchanges information with your EMIS and TPP SystemOne Electronic Health Record (EHR) systems, reducing the need to duplicate entry from Universal Care Plan to EHR. The list of fields that are exchanged are available [here for EMIS](#) users and [here for TPP SystemOne](#) users.

What this means is that when you input new or update certain information in either your EHR or the Universal Care Plan, the next time the Universal Care Plan is opened, the new information will flow into and replace the previous, now out of date information in the other system. This exchange is done using the Valida client and will only happen if the [UCP is launched from Valida](#).

Importing of information from the Universal Care Plan to your EHR will create a new encounter.

**Prognosis field data exchange:**

If any **prognosis category** is entered in the Universal Care Plan this will be imported as a Gold Standard Framework (GSF) coded entry into your EHR (GSF prognostic indicator Stage A (blue) years plus; Stage B (green) months; Stage C (yellow) weeks; Stage D (red) days). Any of these Gold Standard Framework coded entries in your EHR may automatically add the patient to your local End of Life Care (EoLC) register. If your patient has been coded to have a prognosis of “**years**” then you may feel that your patient is not appropriate to be on the EoLC register and therefore you should manually remove them from your list.

Seeing an error on the Valida client? Here is our common issues [guide](#) on how to restore access to the Universal Care Plan from Valida.

The Universal Care Plan is now available for patients to view via the NHS App – find out more [here](#).
