# **Primary Care Asthma Review Pathway**

## **Controller Treatment Guidance**

#### Baseline assessment of control

- 1st step controller treatment:
  - Age < 5y: Soprobec/Clenil Modulite 100mcg 2x
    - daily via MDI and spacer (or licensed equivalent) Age > 5y: Soprobec/Clenil Modulite 200mcg 2x
    - daily via MDI and spacer (or licensed equivalent)

# Review control in 6-12 weeks

- 2nd step controller treatment:
  - Age < 5y: Add montelukast 4mg daily</li>
     Age > 5y: Change to Combisal 50 (or licensed equivalent) via MDI and spacer 2 puffs twice daily think MART if > 12y

Review control in 6-12 weeks (stop montelukast if no benefit)

- 3rd step controller treatment:
  - Age < 5y: Increase to Soprobec/Clenil Modulite 200mcg 2x daily (or licensed equivalent)
     Age > 5y: Increase to Combisal 125 (or licensed equivalent) via MDI and spacer 2 puffs twice daily +/- add Montelukast 5mg daily (10mg ≥ 15y) - think MART if > 12y

ICS Uptake < 50%?
